# Optical Field Atomic Ionization

- Harmonics are generated by the tunneling, transport and recombination of electrons
- Atomic ionization proceeds by perturbation of the Coulomb potential in the presence of the electric field of the driving laser pulse
- Ionization rate by the Quasistatic Approximation

### Strong Field Regime

- Measure of field strength is given by Keldysh scale parameter:
- $\frac{1}{\gamma} = \frac{eE_a}{\omega_0\sqrt{2mW_b}}$   $\frac{1}{\gamma} > 1$  defines the strong field regime
- Coulomb potential is suppressed
- Electron can tunnel through the potential barrier

### HHG Microscopic Analysis

• HHG photon radiation dependent on the acceleration of the electron

 $\frac{\partial^2}{\partial t^2} < \psi_e |r|\psi_e >$ 

- Two simplifying assumptions: 1. Electron is a free particle in continuum states 2. Only ground state interactions are considered
- Under these assumptions:

 $d_n(\tau) = \sum_{\tau_1} \frac{1}{\sqrt{i}} a_{ion}(\tau_b) a_{propogation}(\tau_b, \tau) a_{recombination}(\tau)$ 

### Microscopic II

 Model valid for linearly polarized light • Elliptically polarized light is less efficient

•  $a_{propogation}$  time is on the order of the oscillation period of the electric field

• Photon emission occurs upon recombination with the ground state

### Microscopic IV

 $(\hbar\omega)_{max} = I_p + 3.2U_p$ 

$$U_p = \frac{2\pi c a_0 I_L}{\omega^2}$$

Periodic process yields <u>odd</u> harmonics of the laser field

# Macroscopic Analysis (Propagation)

• Macroscopic effects reduce HHG efficiency

- 1. Absorption excitation of core atomic states by harmonic photon
- 2. Dephasing difference in propagating velocities of laser and harmonic photon
- 3. Defocusing distribution in electron density profile due to laser focus

### Phase Matching

- Goal: Increase the coherence length of the harmonic beam and the driving laser pulse for a given harmonic order
- Phase match condition:  $\Delta k = qk_{laser} k_{x-ray} = 0$
- Use fiber to increase path length of laser relative to harmonic beam

$$k_{laser} \approx \frac{2\pi}{\lambda} + \frac{2\pi N_a \delta(\lambda)}{\lambda} - N_e r_e \lambda - \frac{\lambda}{2}$$

 $\frac{u_{nm}^2\lambda}{\lambda\pi a^2}$
